

# Introduction to Computer Graphics with WebGL

Ed Angel

## Square Program Part 5

---

---

---

---

---

---

---

## WebGLPrimitives

---

---

---

---

---

---

---

## Why triangles?

- All triangles are
  - simple: edges can't cross
  - flat: a triangle defines a unique plane
  - convex: any line segment connecting two points in the triangle is entirely in the triangle
  - easy to render
  - degenerate triangles in which all three vertices lie in a line are not a problem for rasterizer

---

---

---

---

---

---

---

## Coordinate Systems

- The units in **points** are determined by the application and are called *object, world, model or problem coordinates*
- Viewing specifications usually are also in object coordinates
- Eventually pixels will be produced in *window coordinates*
- WebGL also uses some internal representations that usually are not visible to the application but are important in the shaders
- Most important is *clip coordinates*

---

---

---

---

---

## Coordinate Systems and Shaders

- Vertex shader must output in clip coordinates
- Input to fragment shader from rasterizer is in window coordinates
- Application can provide vertex data in any coordinate system but shader must eventually produce `gl_Position` in clip coordinates
- Simple example uses clip coordinates

---

---

---

---

---

---

---

---

## WebGL Camera

- WebGL places a camera at the origin in object space pointing in the negative  $z$  direction
- The default viewing volume is a box centered at the origin with sides of length 2

---

---

---

---

---

---

---

---

## Orthographic Viewing

In the default orthographic view, points are projected forward along the  $z$  axis onto the plane  $z=0$

---

---

---

---

---

---

---

---

## Viewports

- Do not have use the entire window for the image:  
`gl.viewport(x,y,w,h)`
- Values in pixels (window coordinates)

---

## Transformations and Viewing

- In WebGL, we usually carry out projection using a projection matrix (transformation) before rasterization
- Transformation functions are also used for changes in coordinate systems
- Pre 3.1 OpenGL had a set of transformation functions which have been deprecated
- Three choices in WebGL
  - Application code
  - GLSL functions
  - MV.js
